## Business Controls

Application can be kept centralized server due to this Single view of all branches with their transactions at each level to compare all the branches and Warehouse or Store. Branch will be able to view his own transactions and not the transactions of other branch.

Specific type of transactions can be routed through each branch, with the use of this option, specified transactions of specified branch will happen after approval.

Product analysis can be viewed branch wise or cumulative for the region or cumulative for the whole company at each level.

1. Two level authentications are build to secure the application one is HTTP security second is application level security.

2. Role based access to the options from the main menu of the application; User will be able to access / see the options from the main menu of the application according to the role / options assigned to him like read, write, delete, print etc.

3. User can be defined to use certain options on the main menu, so only those main menu's will be shown to which user have access, he will not be able to see other main menu's.

4. Authentication on login id and password, Login id will be blocked after three wrong attempts. System administrator is authorized to allot the new password, but he will not be able to read the old password. Even the password is stored in encrypted format in the database.

5. Session got expired if user is not doing any transaction or system is idle from last 15 minutes (session expiry can be changed according to requirements)

6. .net technologies & MS- Sql Server is the most robust, secure, scalable and a cross-platform framework for e-Business applications.
